

# Are We Wrong360?

A User and Products Analysis by P3

Lilliana Nishihira, Annette Paciorek, Jennifer Ruddock PhD

# What is Rong360?

The screenshot displays the Rong360 website interface. At the top left is the Rong360 logo. To its right, the text "Nationwide [Switch city]" is visible. A navigation bar contains "Home", "Loan", and "Mortgage" buttons. Below this is a green banner with the text "Open channel 360 customer complaints, collection violence hotline: 010-84359120 (early 8: 00- 9:00 pm)". The main content area features a loan application form with the following fields: "loan amount" (5.0, Ten thousand yuan), "Loan term" (12 months), and "Professional identity" (unlimited). A yellow "Search loan" button is positioned below these fields. To the right of the form are three circular icons with text: "1万家金融机构", "免费申请", and "最快1天放款". On the left side of the form, there is a vertical menu with options: "personal / business loans", "purchase loans", "purchase loan", "credit card", "melt applications 360", and "public finance". At the bottom of the form, it states "Popular loans: 50,000 personal loans 100,000 personal loans 200,000 corporate loans 500,000 corporate loans".

- Chinese loan platform
- Streamlines process for loan applicants
- Provides access to wider customer base for banks

<http://www.rong360.com/>

## Insights:

- Loan products can be segmented into describable levels: Gold, Silver and Bronze
- User platform activity data on Rong360 may reduce applicant risk and lead to higher approval rates.

# Loan Levels

## GOLD

- Largest Loans
- Most Information required
- Longest decision turnaround

## SILVER

- Medium Sized Loans
- Lower Application Rate

## BRONZE

- Smallest Loan
- Highest Application Rate
- Least Amount of Information Required for Application

# About the Data

- **Loan product data:** All of the loans available on Rong360.com (48, 433) and 33 dimensions per data point, including the city, loan term, and which personal information is needed in order to apply
- **User application data:** Applications submitted by users, including users' personal information as well as loan information, like the type of loan and amount sought (1,506,097 x 89)
- **User web data:** Records of users' page views on Rong360 website (238958 x 12)
- **Order data:** Basic record of loan applications and approval result (143152, 6)

# Data Cleaning

## Pros:

- Relatively small data sets
- Segmented data allows for distribution of labor
- Several features were nearly uniform or mostly NA - allowed us to reduce dimensions

## Cons:

- Information was encoded - meaning of categories was obfuscated and harder to orient ourselves in the data
- How to impute missing values
- Inconsistencies across various banks with respect which information they request and how it's recorded

# Data Analysis - Who is more likely to approved?

Users' careers matter

Whether users pay social security matters

Whether Rong360 believes the applications are genuine matters

## Other important characteristics

- Some important factors emerge through visualizations
- We use more rigorous methods to confirm what we've observed and reveal other determining characteristics
- Chi-squared tests failed to provide insight
- Random forest - generated feature importance was consistent with domain knowledge expectations and visualizations

**How user behavior on Rong360 site  
corresponds to loan approval**

Random Forest\* feature importance  
of application data

Notice loan term and loan limit are  
two of the three most important  
factors

\*Train error: 0.06428  
Test error: 0.14289

Most important user habits as determined by random forest\*

\*Train error: 0.14149  
Test error: 0.17155

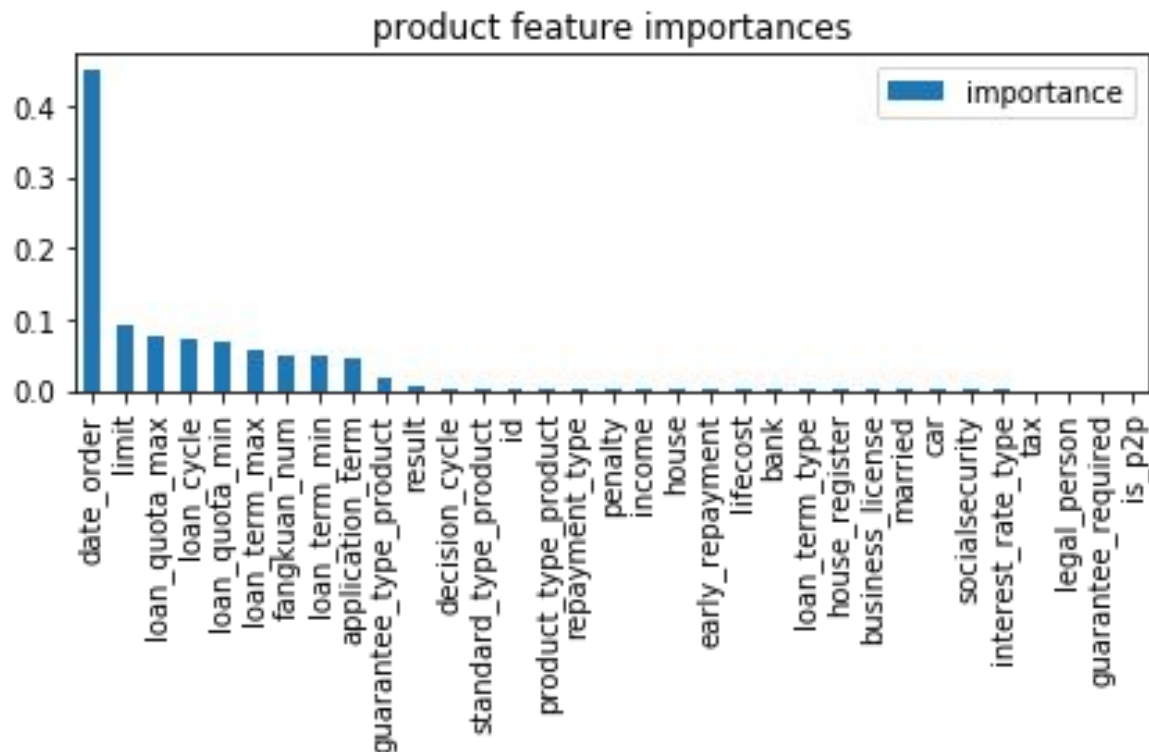

When we have more user data (PV's etc) the general loan approval rate increases.

# Understanding the loan landscape of Rong360

Which characteristics do the most sought-after loans have in common?

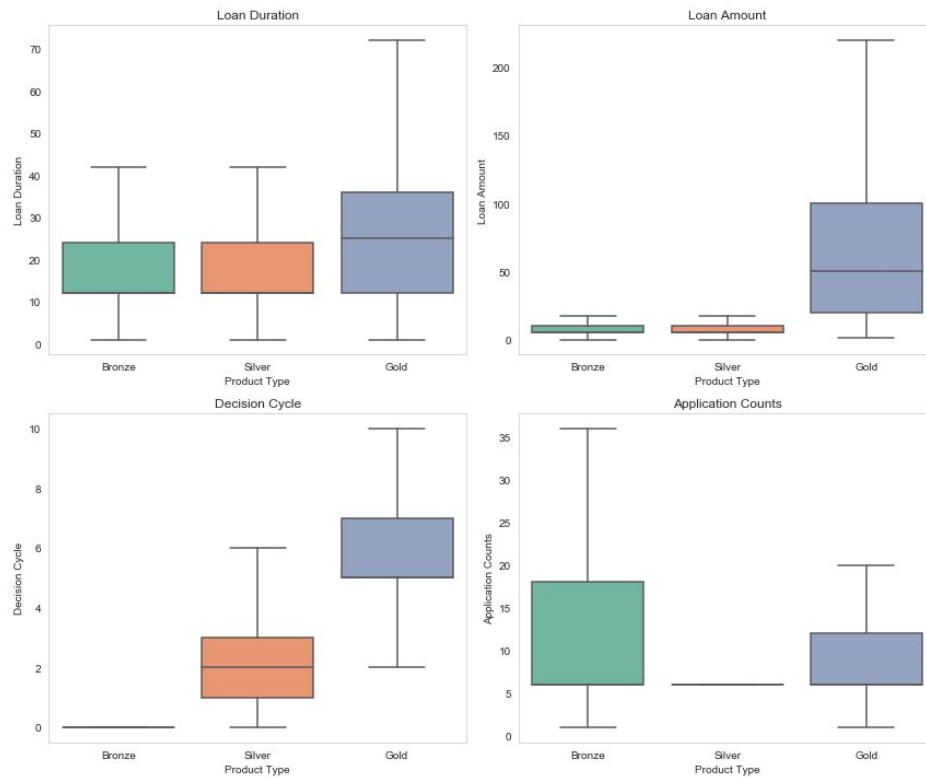

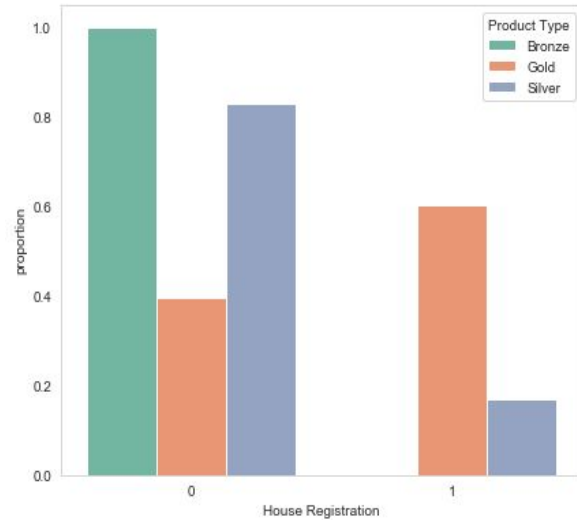

**Which features determine the tier of a loan on Rong360?**

## Three loan tiers

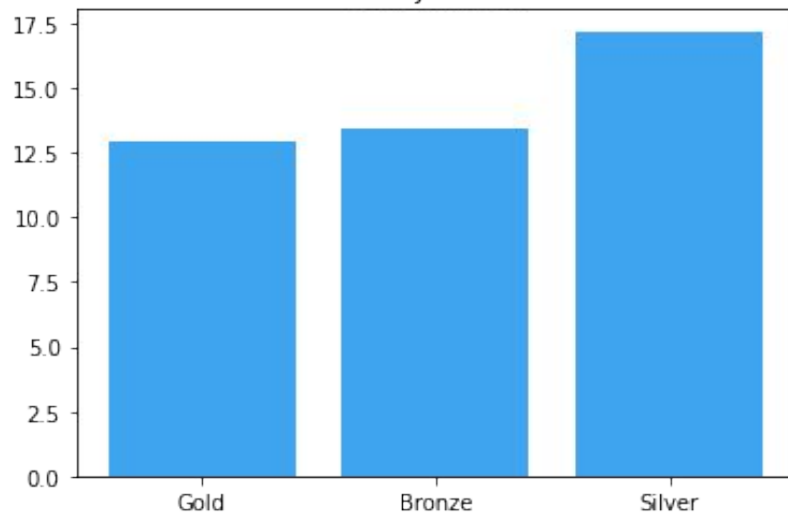

- Gold
- Silver
- Bronze

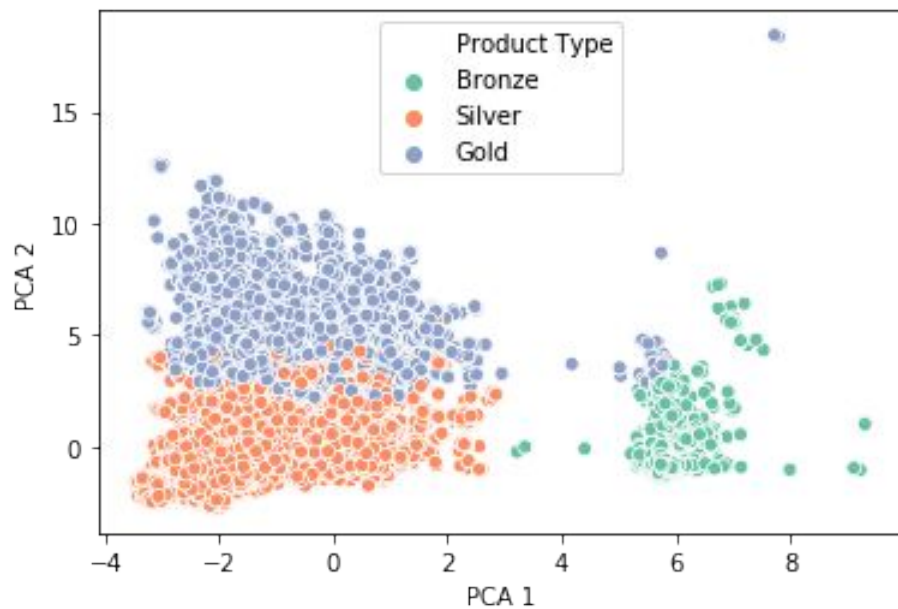

PVs by Cluster

## PCA on loan characteristics

# Recommendations

## For Banks:

- Banks with products in the silver cluster can increase their numbers of applicants by loosening their requirements

## For Consumers:

- Individuals and businesses that struggle to get a loan can approach banks through the Rong360 website to lower their risk profiles

## Further Avenues of Research

- Digging deeper into the effect of location on loan approval
- Feature engineering a loan approval rate per bank, seeing how # of bank branches correlates with loan approval rate
- Digging deeper into a time series analysis
- Gaining more insight into the makeup of the clusters, use product types to further cluster users.

Talk about clustering

Elbow plots (in the appendix?)

Talk about the more technical aspects of clustering (like normalization, parameter tuning, can put in the appendix)

Some more interpretation here about the clusters

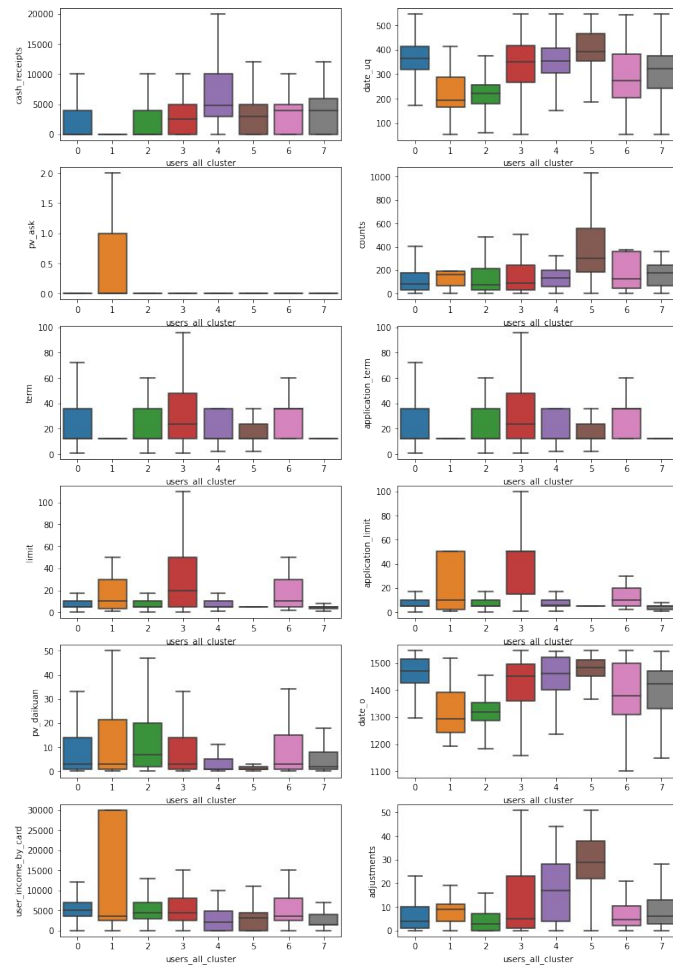

Are these findings consistent with what we expected? Was anything surprising?

Banks can look at popular clusters and try to model themselves after them, likewise for users trying to increase their likelihood of approval

User clusters that could be more well defined

## Product Levels:

Gold - Highest Limit, lowest approval rate and requires most “higher class” information. (Has car, has house, etc.)

Silver - Lower limit, faster turnaround.

Bronze - Lowest limit, very little information required to apply.

Likelihood of loan approval drops as number of page views increases

A closer look at approval rates by date

Interesting avenue of further exploration

Partly because the dates were encoded, we chose to focus on understanding what makes loan products popular
